Circular Economy in the Smartphone Industry

Case Studies on Reuse, Refurbishment, and Recycling

A presentation By Abhishek Karnam & Karthik S M

This presentation explores how circular economy strategies can reduce electronic waste, extend smartphone lifespans, and create sustainable business models.

Introduction

Smartphones are essential devices in modern life, but their production and disposal create major environmental challenges.

Key issues include:

- Rapid device replacement cycles
- Growing electronic waste
- High demand for rare materials

Circular economy strategies aim to **reduce waste and improve resource efficiency**.

Circular Economy Concept

A circular economy focuses on keeping products and materials in use for as long as possible.

Key principles:

Reduce
resource consumption

Reuse
products for longer life

Repair
damaged devices

Refurbish
and resell products

Recycle
valuable materials

Goal: **Create a sustainable and closed-loop product system.**

Case Study 1: Circular Economy in Mobile Phones

This European study analyzes how circular economy strategies can be applied to the mobile phone industry.

The study focuses on:

- Recycling valuable materials
- Refurbishment and reuse
- Extending smartphone lifespan

These strategies aim to reduce environmental impact and improve resource efficiency.

Case Study 1 Findings

Key findings from the study:

12-15%

Properly Recycled

of mobile phones are properly recycled in Europe

700M

Unused Phones

unused phones are stored in households

€1B

Valuable Materials

recycling these devices could recover over €1 billion in valuable materials

Circular economy practices can also **create new jobs in refurbishment and recycling industries**.

Case Study 2: Second-Hand Smartphone Market

This study examines how the second-hand smartphone market contributes to circular economy goals.

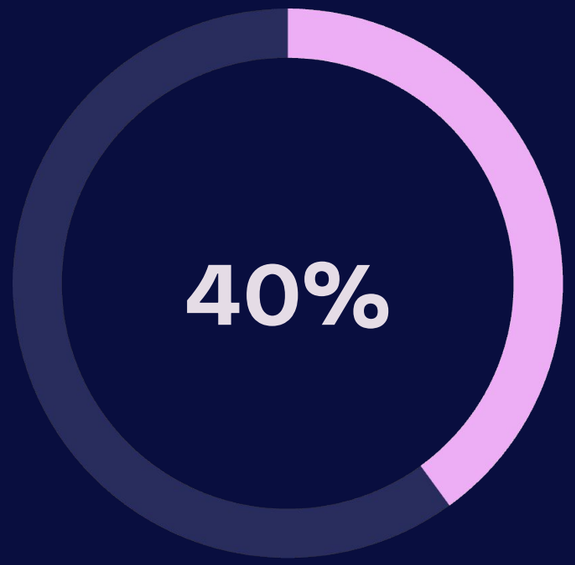
Key aspects analyzed:

- Product reuse and extended lifetimes
- Consumer behavior in second-hand markets
- Environmental impacts of reuse

Reuse helps reduce the need for manufacturing new devices.

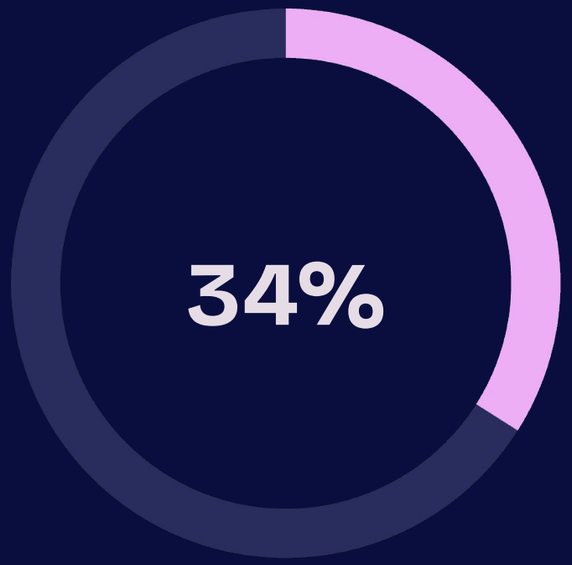
Case Study 2 Findings

Important results include:



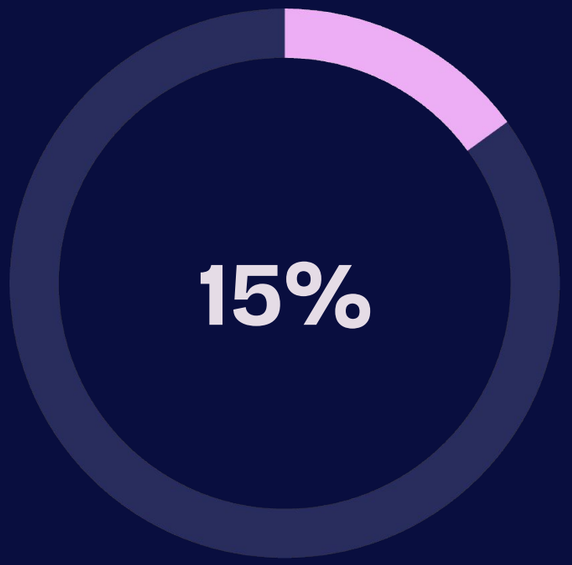
Extended Lifespan

Smartphone reuse increases device lifespan by around 40%



Carbon Reduction

Circular consumption reduces carbon emissions by about 34%



Production Reduction

Second-hand markets reduce smartphone production by around 15%

However, frequent upgrades may reduce some environmental benefits.

Case Study 3: Apple Refurbishment Program

Apple's iPhone Upgrade Program demonstrates a circular business model.

Process:

01

Customers upgrade their devices

02

Old phones are returned to Apple

03

Devices are refurbished and repaired

04

Refurbished phones are resold at lower prices

This system promotes product reuse and reduces waste.

Comparison of Case Studies

The three case studies highlight different circular economy strategies:

Recycling and material recovery
reduce resource extraction

Second-hand markets
extend device lifetimes

Manufacturer refurbishment programs
create closed-loop systems

Together, these strategies help reduce e-waste and support sustainable technology use.

Conclusion

Circular economy approaches are essential for reducing the environmental impact of smartphones.

Key takeaways:

- Reuse and refurbishment significantly extend product life
- Recycling helps recover valuable materials
- Circular business models create economic and environmental benefits

Adopting these strategies can support a **more sustainable future for the electronics industry**.
